

## CE "SELF LOCATING" REAR SHOCK MOUNT FITTING INSTRUCTIONS

Our Latest Self Locating" rear shock mounts are designed to make filtment a breeze. No measuring is required as they fit by sight only. They allow the fitment of telescopic shock absorbers and will work with IRS conversions, hydraulic or air suspension systems. The 90 degree rotated top mount, allows shocks to work without binding under varying height conditions, (Your original Split bus upper shock mount will "bend" the shocks on any bus lowered more than 50mm). These CE shock mounts are not designed for, nor should they be used to fit, Coil Over Shock absorbers, Air Bag Over Shocks or Hydraulic struts.

The shock mount is designed to fit in the floor corner underneath the fuel tank floor area. See above diagram. It should be positioned as high and rearward into the corner shown and will self locate.

The shock mount should sit in a central position on the side of the chassis, Minor adjustment will be of no issue, Check that the inner boxing plate will fit inside the chassis, If not reposition the main bracket accordingly, Mark holes with a scriber and drill 6mm pilot hole, Open up to 12mm diameter,

When you have drilled through your chassis, secure with the supplied fasteners. The completed installation should look like this. Be sure to use the correct length shock which can only be calculated with the vehicle on the ground under full weight. The bolt to bolt measurement will be required to select the right length shock. See our attached chart, Pick up trucks require the mount to be fitted at a slight angle.

## SHOCK ABSORBERS FITMENT CHART
